## 1 Problem 1

Show that, given a training set  $S = \{(x_i, f(x_i))\}_{i=1}^m \subseteq (\mathbb{R}^d \times \{0, 1\})^m$ , there exists a polynomial  $p_S$  such that  $h_S(x) = 1$  if and only if  $p_S(x) \geq 0$ , where  $h_S$  is defined as

$$h_S(x) = \begin{cases} y_i & \text{if } x = x_i \text{ for some } i \\ 0 & \text{otherwise} \end{cases}$$

*Solution.* Consider the polynomial

$$p_S(x) = -\prod_{i=1}^m \|x - x_i\|_2^2 - (f(x) - 1)^2$$

where  $\|\cdot\|_2$  denotes the standard Euclidean norm on  $\mathbb{R}^d$ . Note that, by squaring the  $\|x - x_i\|_2$  terms above, we obtain a true polynomial in the coordinates of  $x \in \mathbb{R}^d$ .

*Claim.*  $h_S(x) = 1$  if and only if  $p_S(x) \geq 0$ .

*Proof of Claim.* Note first that, for arbitrary  $x$ , both  $(f(x) - 1)^2 \geq 0$  and  $\prod_{i=1}^m \|x - x_i\|_2^2 \geq 0$  by the trivial inequality, whence

$$p_S(x) = -\prod_{i=1}^m \|x - x_i\|_2^2 - (f(x) - 1)^2 \leq -\prod_{i=1}^m \|x - x_i\|_2^2 \quad (1)$$

$$p_S(x) = -\prod_{i=1}^m \|x - x_i\|_2^2 - (f(x) - 1)^2 \leq -(f(x) - 1)^2. \quad (2)$$

( $\Leftarrow$ ): We proceed by contraposition. Suppose that  $h_S(x) \neq 1$ . We wish to show that  $p_S(x) < 0$ . Note that, as the image of  $h_S$  is  $\{0, 1\}$ , it follows that  $h_S(x) = 0$ . Now we have two cases.

If  $x = x_j$  for some  $j \in \{1, \dots, m\}$ , then  $0 = h_S(x_j) = f(x_j)$ , whence by (2),

$$p_S(x) \leq -(f(x) - 1)^2 = -1 < 0.$$

If  $x \notin \{x_1, \dots, x_m\}$ , then  $\|x - x_i\|_2^2 > 0$  for all  $i$ , whence by (1) we have

$$p_S(x) \leq -\prod_{i=1}^m \|x - x_i\|_2^2 < 0.$$

( $\Rightarrow$ ): On the other hand, suppose that  $h_S(x) = 1$ . Then it follows that  $x = x_j$  for some  $j \in \{1, \dots, m\}$  and  $f(x_j) = h(x_j) = 1$ . Hence,

$$p_S(x) = -\prod_{i=1}^m \|x - x_i\|_2^2 - (f(x) - 1)^2 = -\|x_j - x_j\|_2^2 \prod_{i=j}^m \|x - x_i\|_2^2 - (1 - 1)^2 = 0.$$

□

## 2 Problem 2

Let  $\mathcal{H}$  be a class of binary classifiers over a domain  $\mathcal{X}$ . Let  $\mathcal{D}$  be an unknown distribution over  $\mathcal{X}$ , and let  $f$  be the target hypothesis in  $\mathcal{H}$ . Fix some  $h \in \mathcal{H}$ . Show that

$$\mathbb{E}_{S|x \sim \mathcal{D}^m} [L_S(h)] = L_{(\mathcal{D}, f)}(h).$$

*Proof.* This claim follows from the construction of the product measure, the definition of the pushforward measure, and some elementary manipulation. By definition,

$$L_{(\mathcal{D}, f)}(h) = \mathcal{D}(\{x \in \mathcal{X} : f(x) \neq h(x)\}).$$

Let  $\pi_i : \mathcal{X}^m \rightarrow \mathcal{X}$  denote the  $i^{\text{th}}$  projection map. Note that, for any measurable subset  $A \subseteq \mathcal{X}$  and  $(x_1, \dots, x_m) \in \mathcal{X}^m$ , we have

$$\mathbb{1}_A(x_i) = \mathbb{1}_A(\pi_i((x_1, \dots, x_m))) = \mathbb{1}_{\pi_i^{-1}(A)}((x_1, \dots, x_m)). \quad (3)$$

Recall, by construction of the product measure, that the product measure  $\mathcal{D}^m$  pushes forward to the original measure  $\mathcal{D}$  under each of the projection maps  $\pi_i$ , namely

$$\mathcal{D}^m(\pi_i^{-1}(A)) \stackrel{\text{definition}}{=} (\pi_i)_* \mathcal{D}^m(A) = \mathcal{D}(A) \text{ for all measurable } A \subseteq \mathcal{X}. \quad (4)$$

Finally, we expand the expectation and write,

$$\begin{aligned} \mathbb{E}_{S|x \sim \mathcal{D}^m} [L_S(h)] &= \int_{\mathcal{X}^m} L_S(h) d\mathcal{D}^m(x_1, \dots, x_m) = \int_{\mathcal{X}^m} \frac{|\{\tilde{x} \in S|x : h(\tilde{x}) \neq f(\tilde{x})\}|}{m} d\mathcal{D}^m(x_1, \dots, x_m) \\ &= \frac{1}{m} \int_{\mathcal{X}^m} \sum_{i=1}^m \mathbb{1}_{\{x \in \mathcal{X} : h(x) \neq f(x)\}}(x_i) d\mathcal{D}^m(x_1, \dots, x_m) \\ &\stackrel{(3)}{=} \frac{1}{m} \sum_{i=1}^m \int_{\mathcal{X}^m} \mathbb{1}_{\pi_i^{-1}(\{x \in \mathcal{X} : h(x) \neq f(x)\})}((x_1, \dots, x_n)) d\mathcal{D}^m(x_1, \dots, x_m) \\ &= \frac{1}{m} \sum_{i=1}^m \mathcal{D}^m(\pi_i^{-1}(\{x \in \mathcal{X} : h(x) \neq f(x)\})) \\ &\stackrel{(4)}{=} \frac{1}{m} \sum_{i=1}^m \mathcal{D}(\{x \in \mathcal{X} : h(x) \neq f(x)\}) = \mathcal{D}(\{x \in \mathcal{X} : h(x) \neq f(x)\}) = L_{(\mathcal{D}, f)}(h) \end{aligned}$$
